In addition, the timer receptacle at the rear of the receiver provides an outlet connection for external appliances which is controlled by the normal function of the alarm and sleep control mechanism of the clock. The radio OFFON switch adjacent to the timer outlet provides control of radio operation so that the radio receiver may be tuned off if so desired while using the external appliance. When radio operation is to be resumed, this switch must be tuned to the on position. RADIO CIRCUIT ALIGNMENT tion mark. If it does not, remove the control wheel from the gang condenser shaft and replace it for correct position. The oscillator output cable ground lead is connected to receiver chassis. 6. For alignment of the oscillator and antenna trimmers, the input signal should be inductively coupled to the radio loop antenna, Ll, by connecting a fourturn, sixinch diameter loop of bell wire across the signal generator output terminals, and then locating the loop to face the radio antenna loop about one foot away. To prevent possible errors in reference to previous signal measurement readings, the loop with respect to the radio loop should not be changed during any one set of adjustments. With Alarm Set knob pulled out, continue to rotate Time Set shaft clockwise and note that the Alarm vibrator arm drops against field core approximately 710 minutes later. 5. Set alarm at some other selected position and make sure mechanism actuates within limits in 1 minute. 6. Check alarm tone of vibrator. This can be adjusted by either bending vibrator arm nearer or farther away from field core. Bend arm near anchor point. CLEANING AND LUBRICATION To clean, completely disassemble and clean all moving parts in carbon tetrachloride or some similar cleaner. The inside of the sleeves and shaft surfaces may be cleaned of oxidized oil by rubbing with a fine grade of steel wool dampened in carbon tetrachloride. Do not use too much oil and apply by means of a small wire drop oiler. Too much oil collects dust and later oxidizes. Clock time set shaft bends and rubs against hole in clock bracket. 3. Noisy Clock Rotor defective, alarm armature improperly adjusted, loose parts, or binding of moving parts. C. John E. Rider This spring provides tension for proper segment gear and cam operation.
